

Towards Environmentally *Sustainable & Equitable* Computing

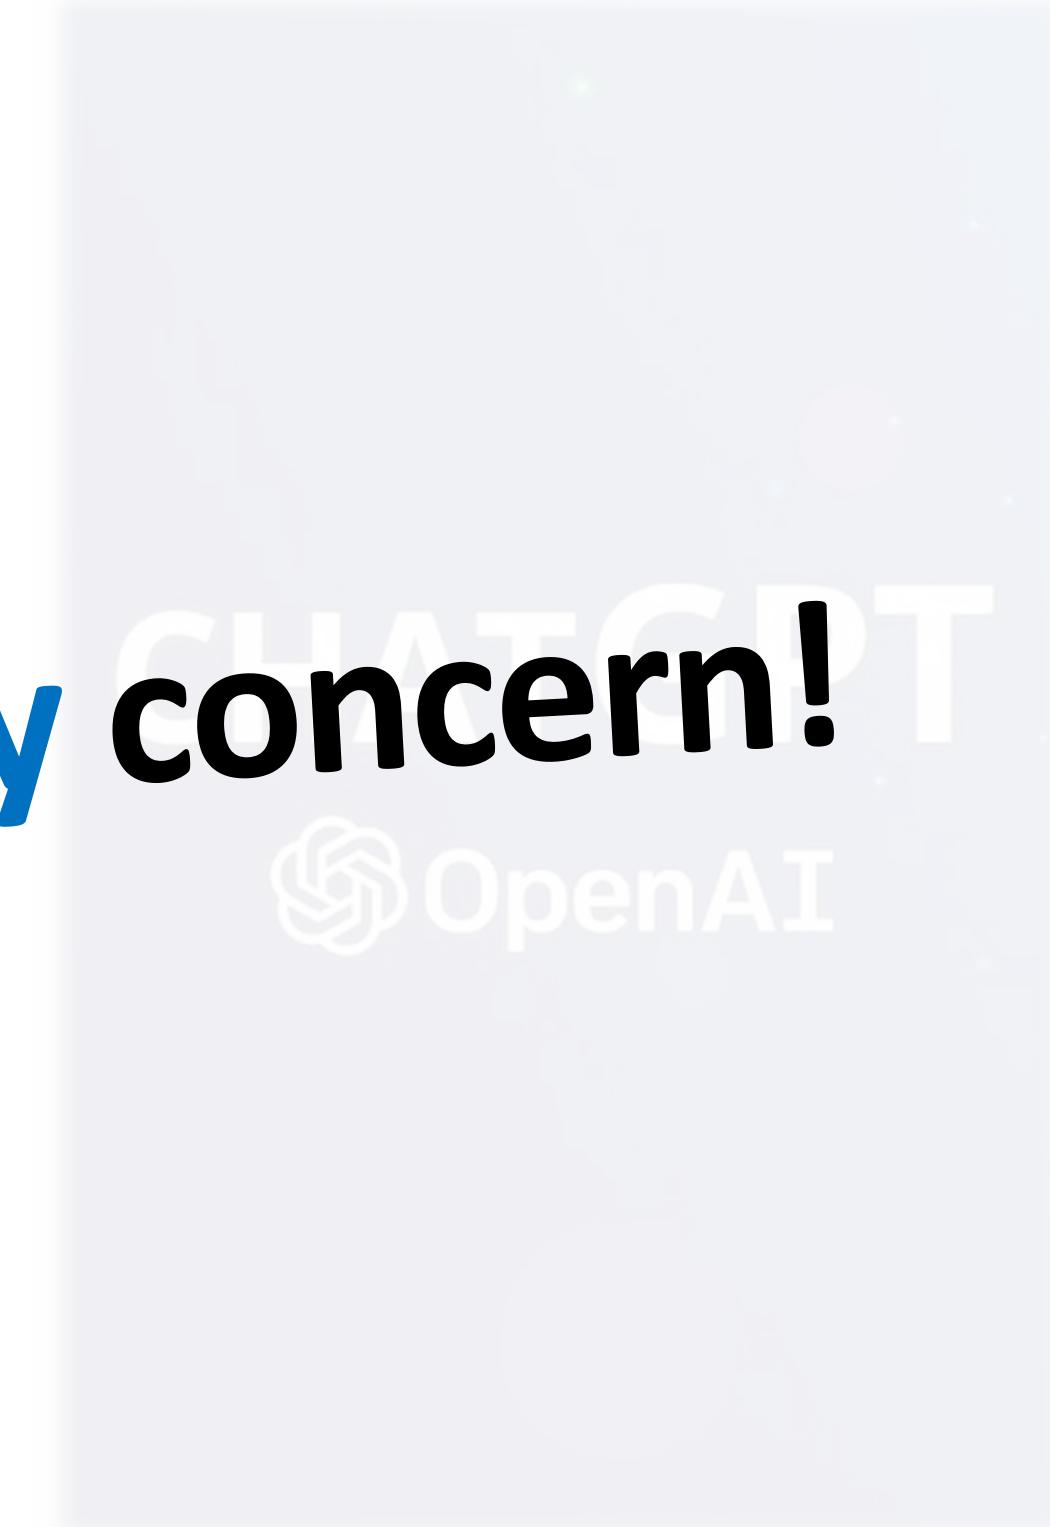

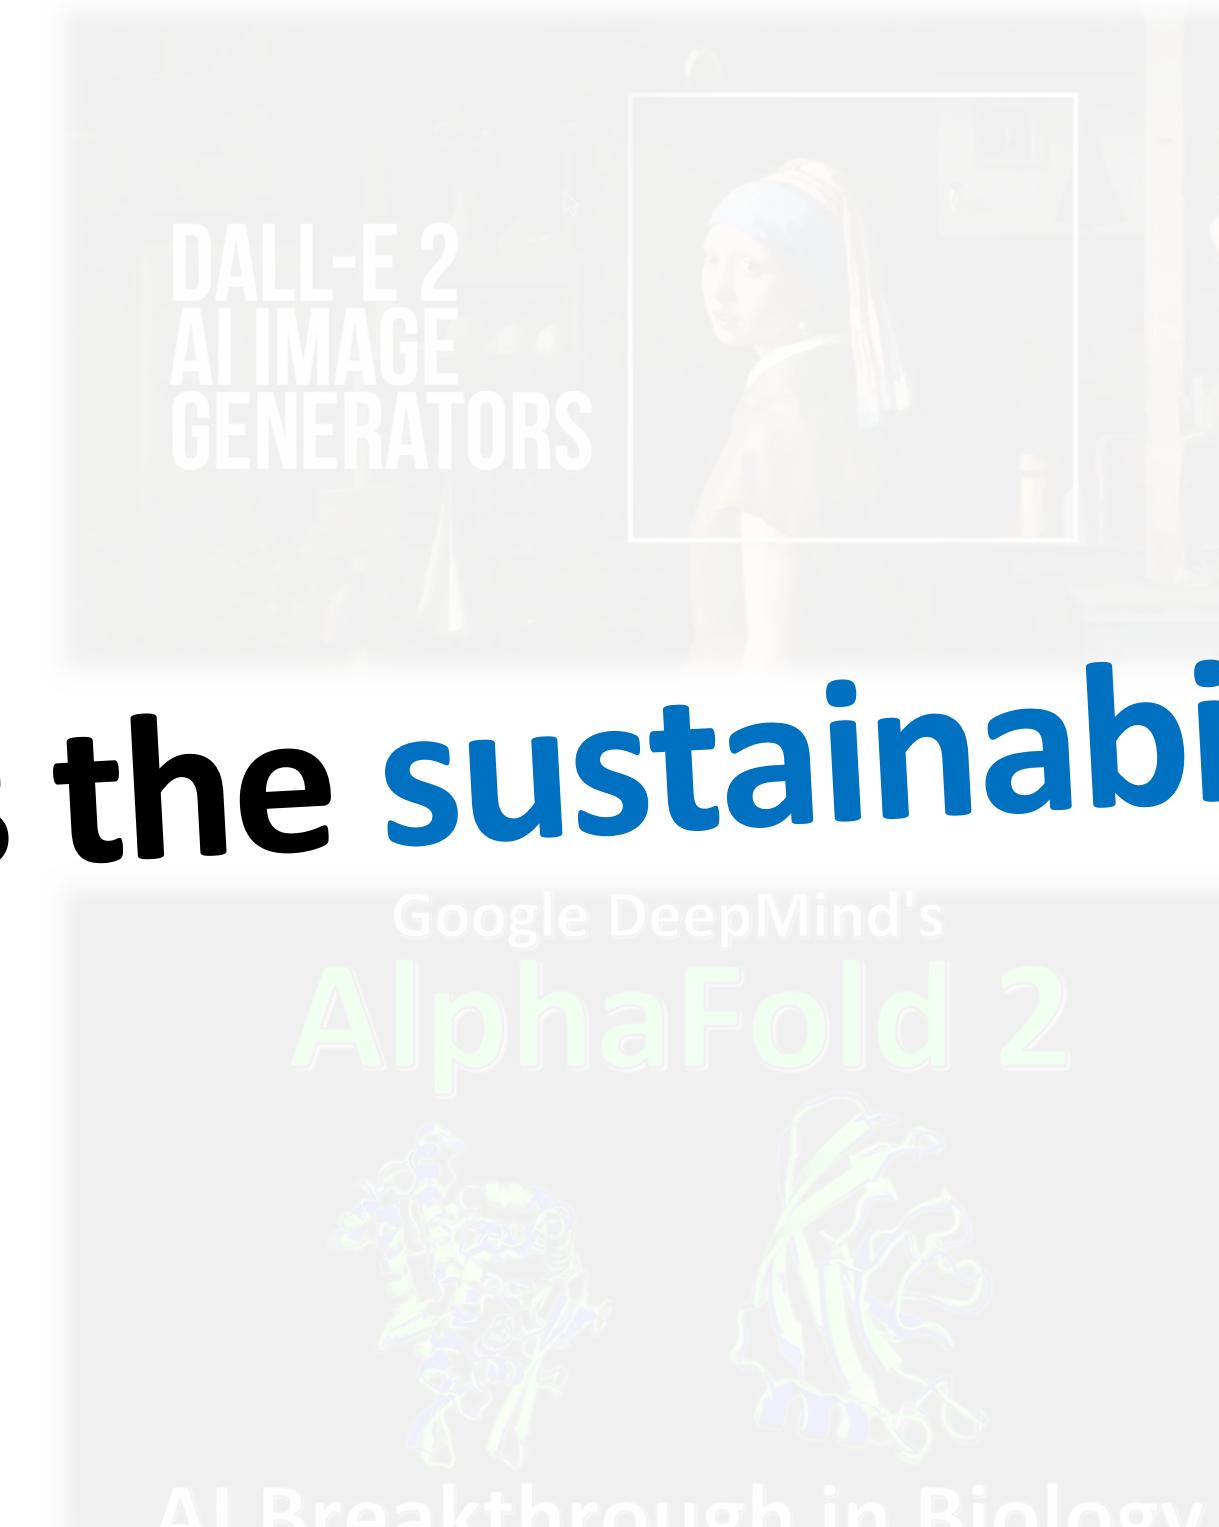

Shaolei Ren

The demand for AI and computing is soaring!

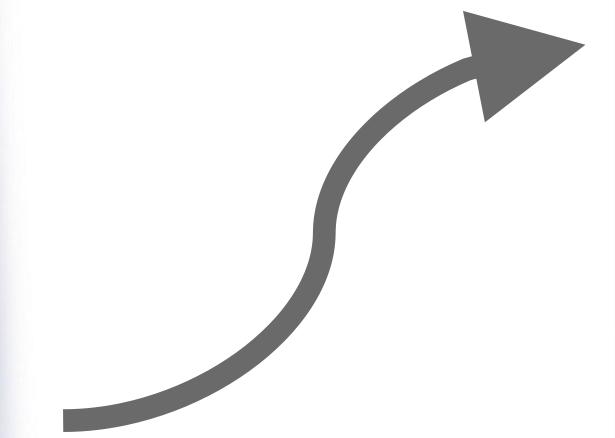

The demand for AI and computing is soaring!

... and so is the **sustainability** concern!

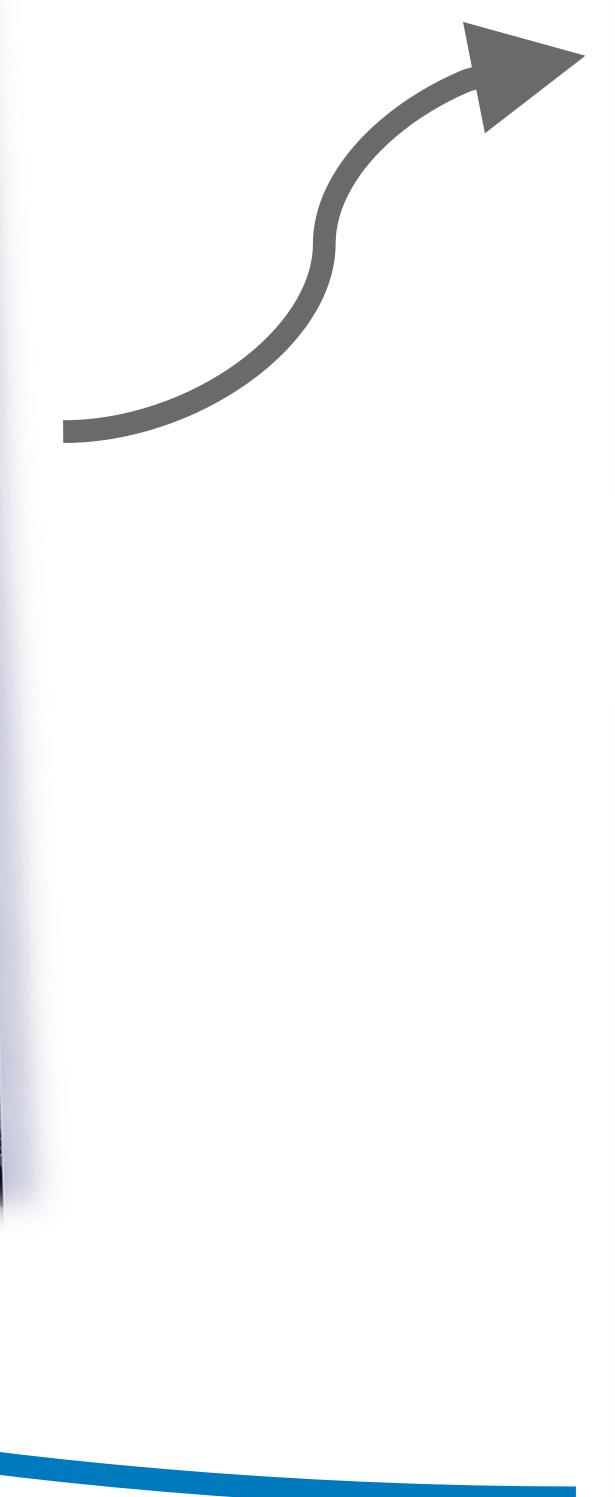

Computing is resource-intensive and power-hungry

Electronic waste or e-waste

Is the fastest growing waste stream

Computing is resource-intensive and power-hungry

Electronic waste or e-waste

Is the fastest growing waste stream

Computing is resource-intensive and power-hungry

Per IEA, data centers use about **300 TWh electricity** in 2022, or 1-2% of the global electricity demand (0.2-0.4% global energy demand).

Electricity = Carbon

Electricity = Carbon + Water + Air & thermal pollution + ...

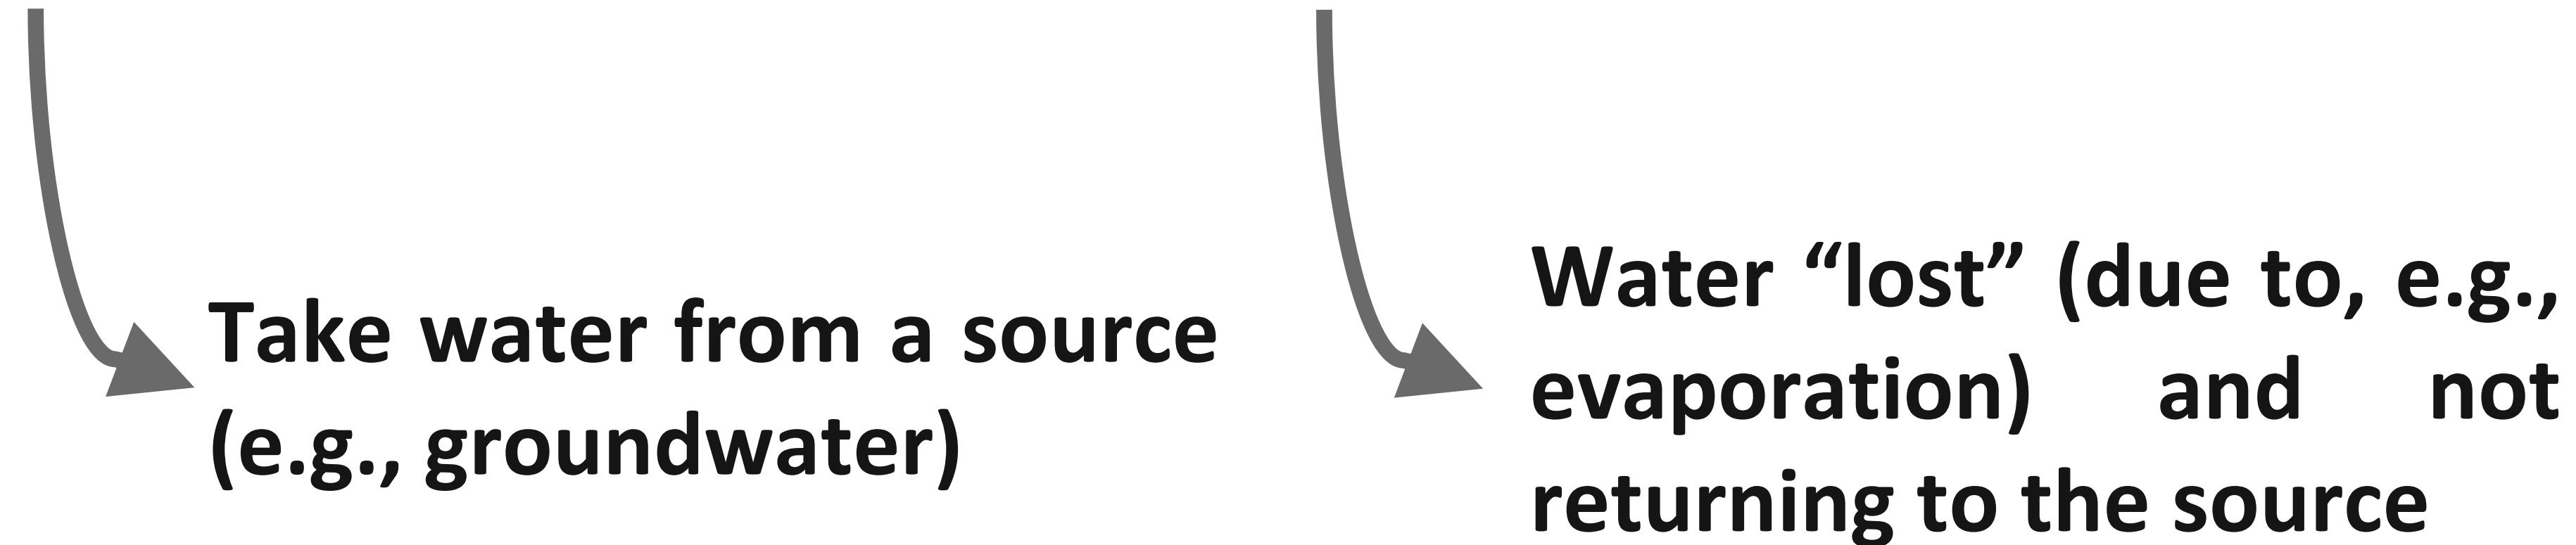

Electricity = Carbon + Water + Air & thermal pollution + ...

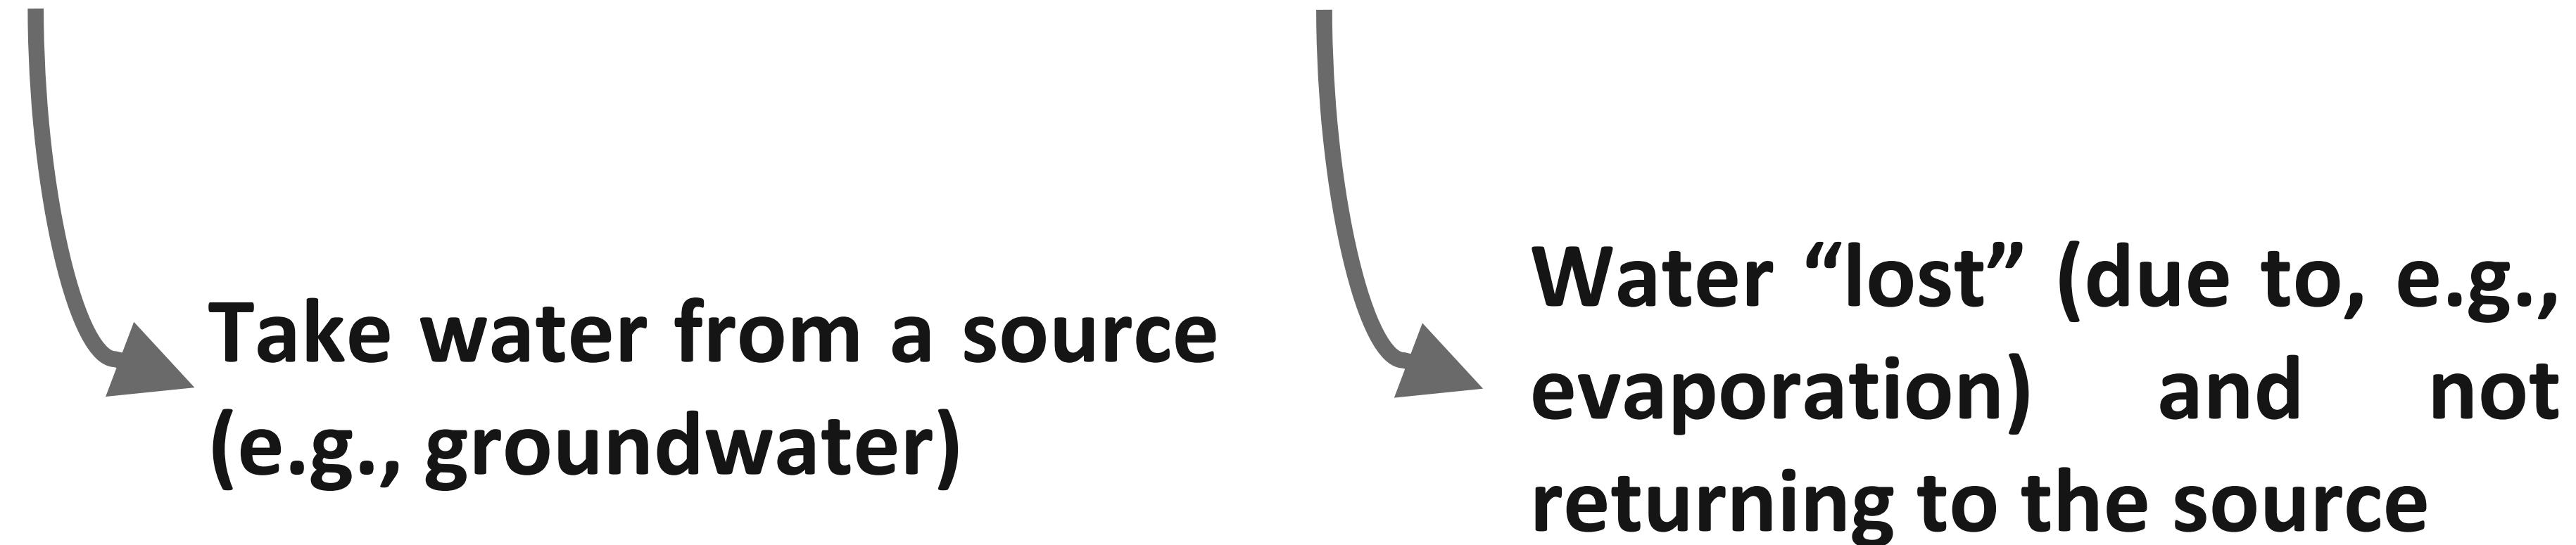

Carbon != Water

One footprint is “*a complement to and not a substitute for*” the other.

Water withdrawal vs. water **consumption** for electricity

Water withdrawal vs. water **consumption** for electricity

1 kWh = roughly 44-100 L water withdrawal (excluding hydropower)

1 kWh = 3.14 L water **consumption**

Data centers are guzzling water!

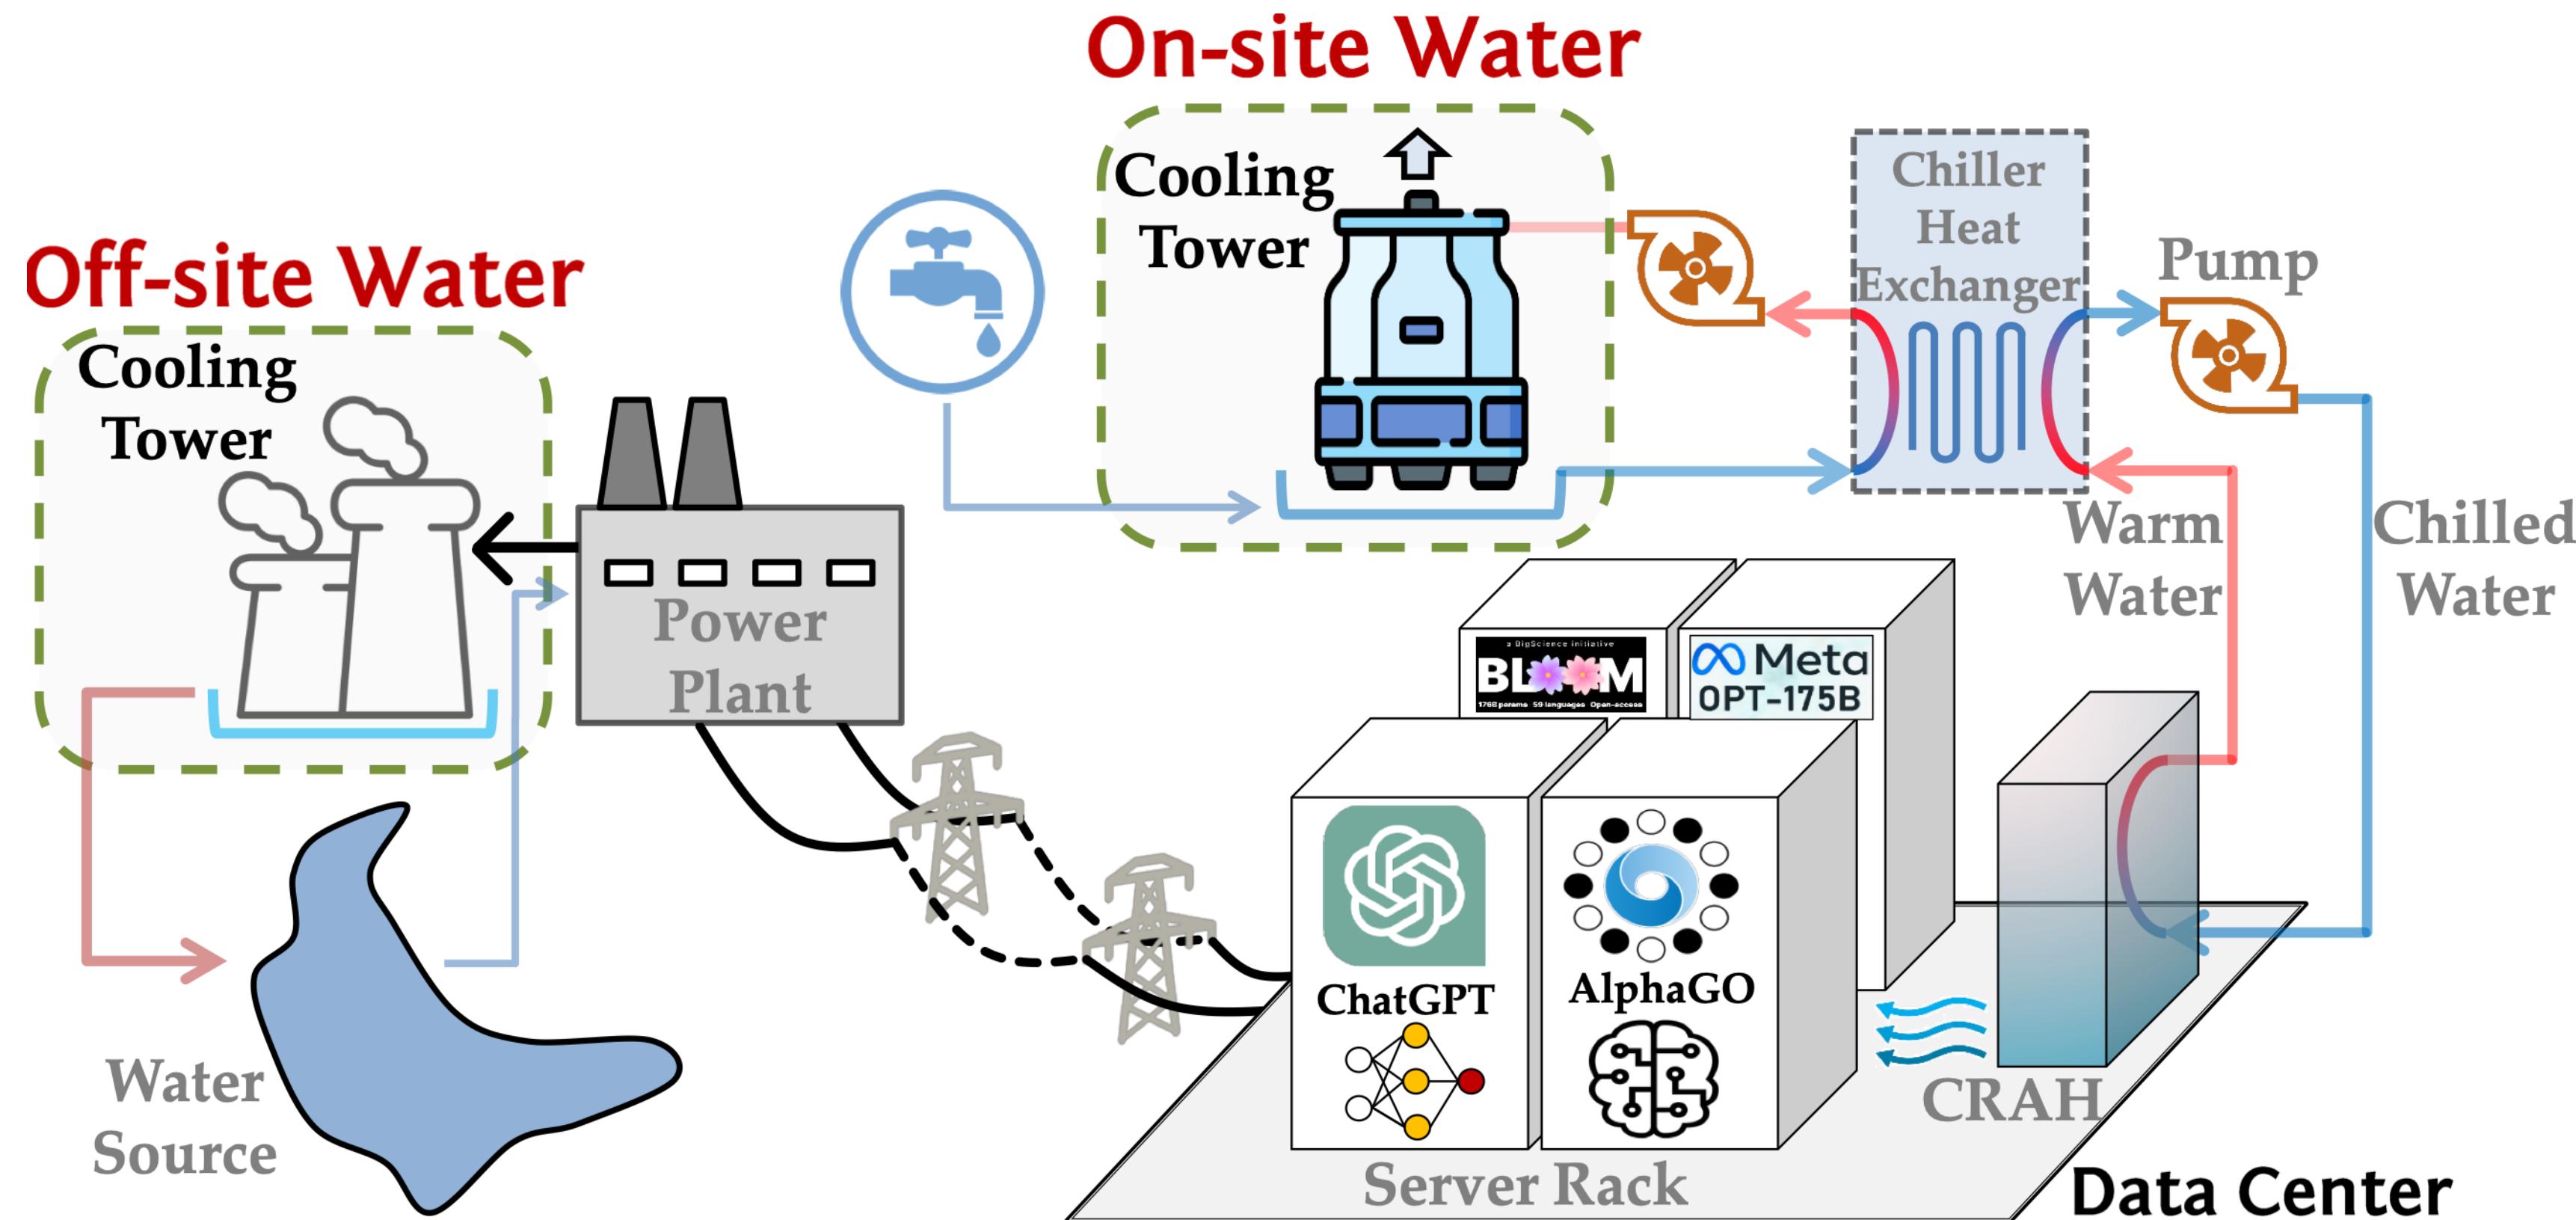

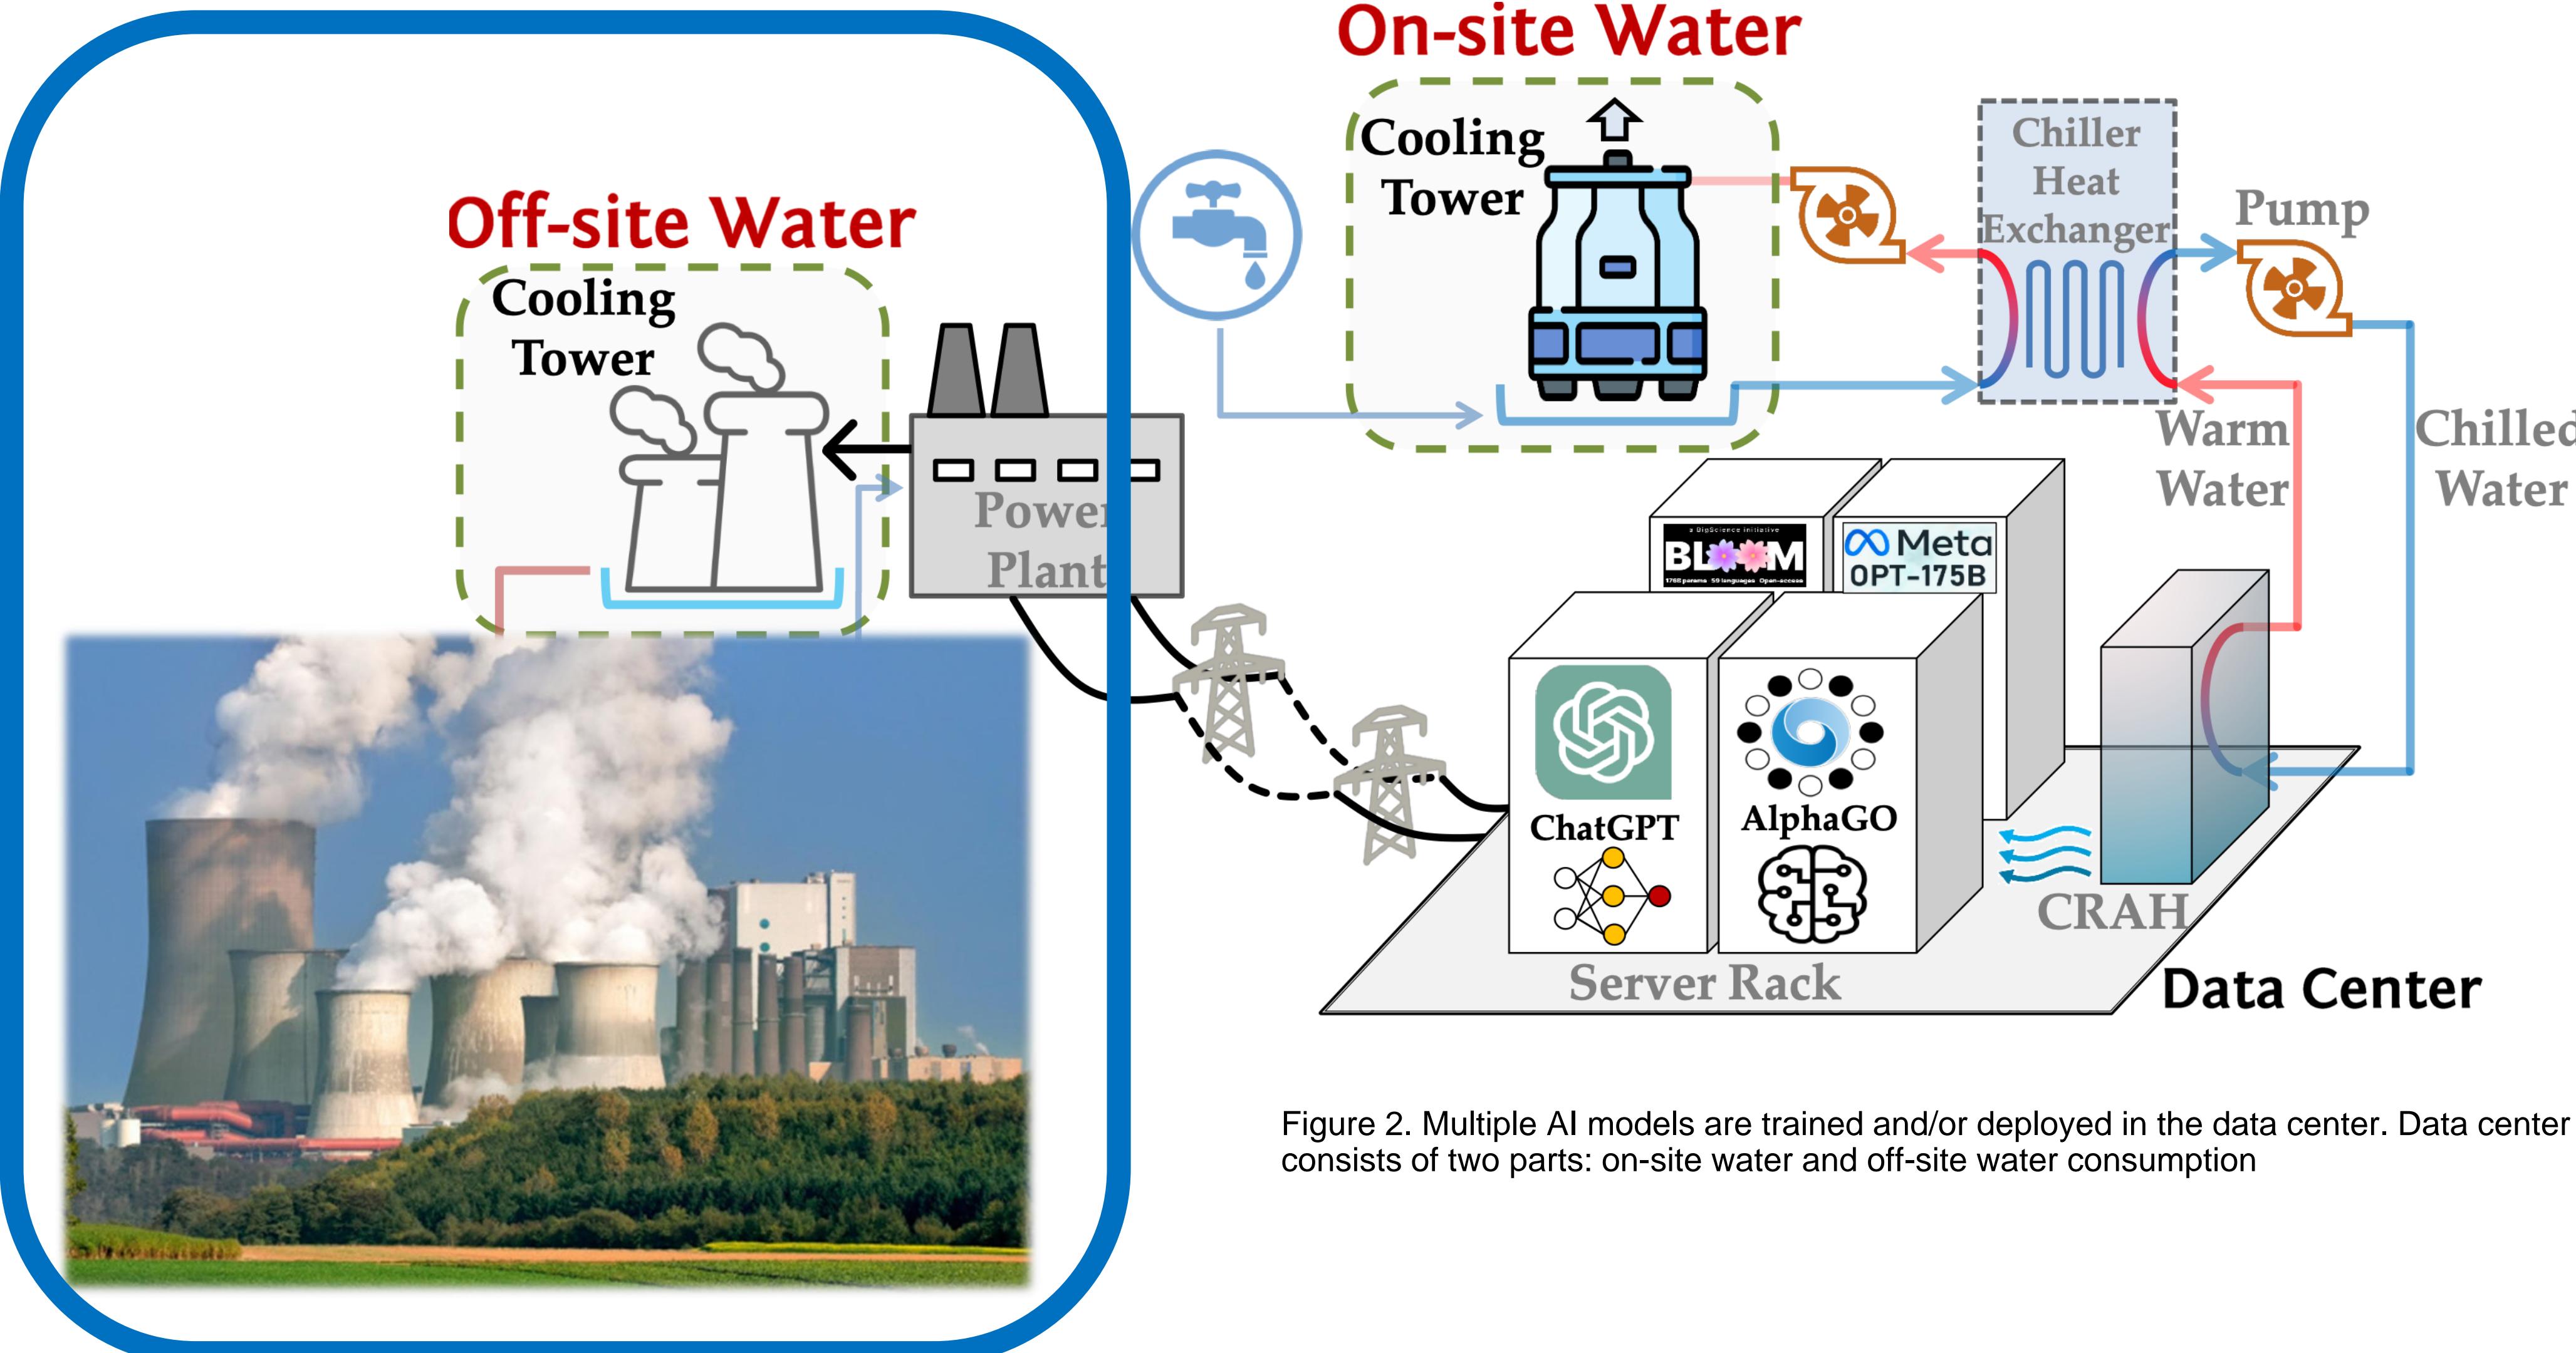

Figure 2. Multiple AI models are trained and/or deployed in the data center. Data center water footprint consists of two parts: on-site water and off-site water consumption

Data centers are guzzling water!

Data centers are guzzling water!

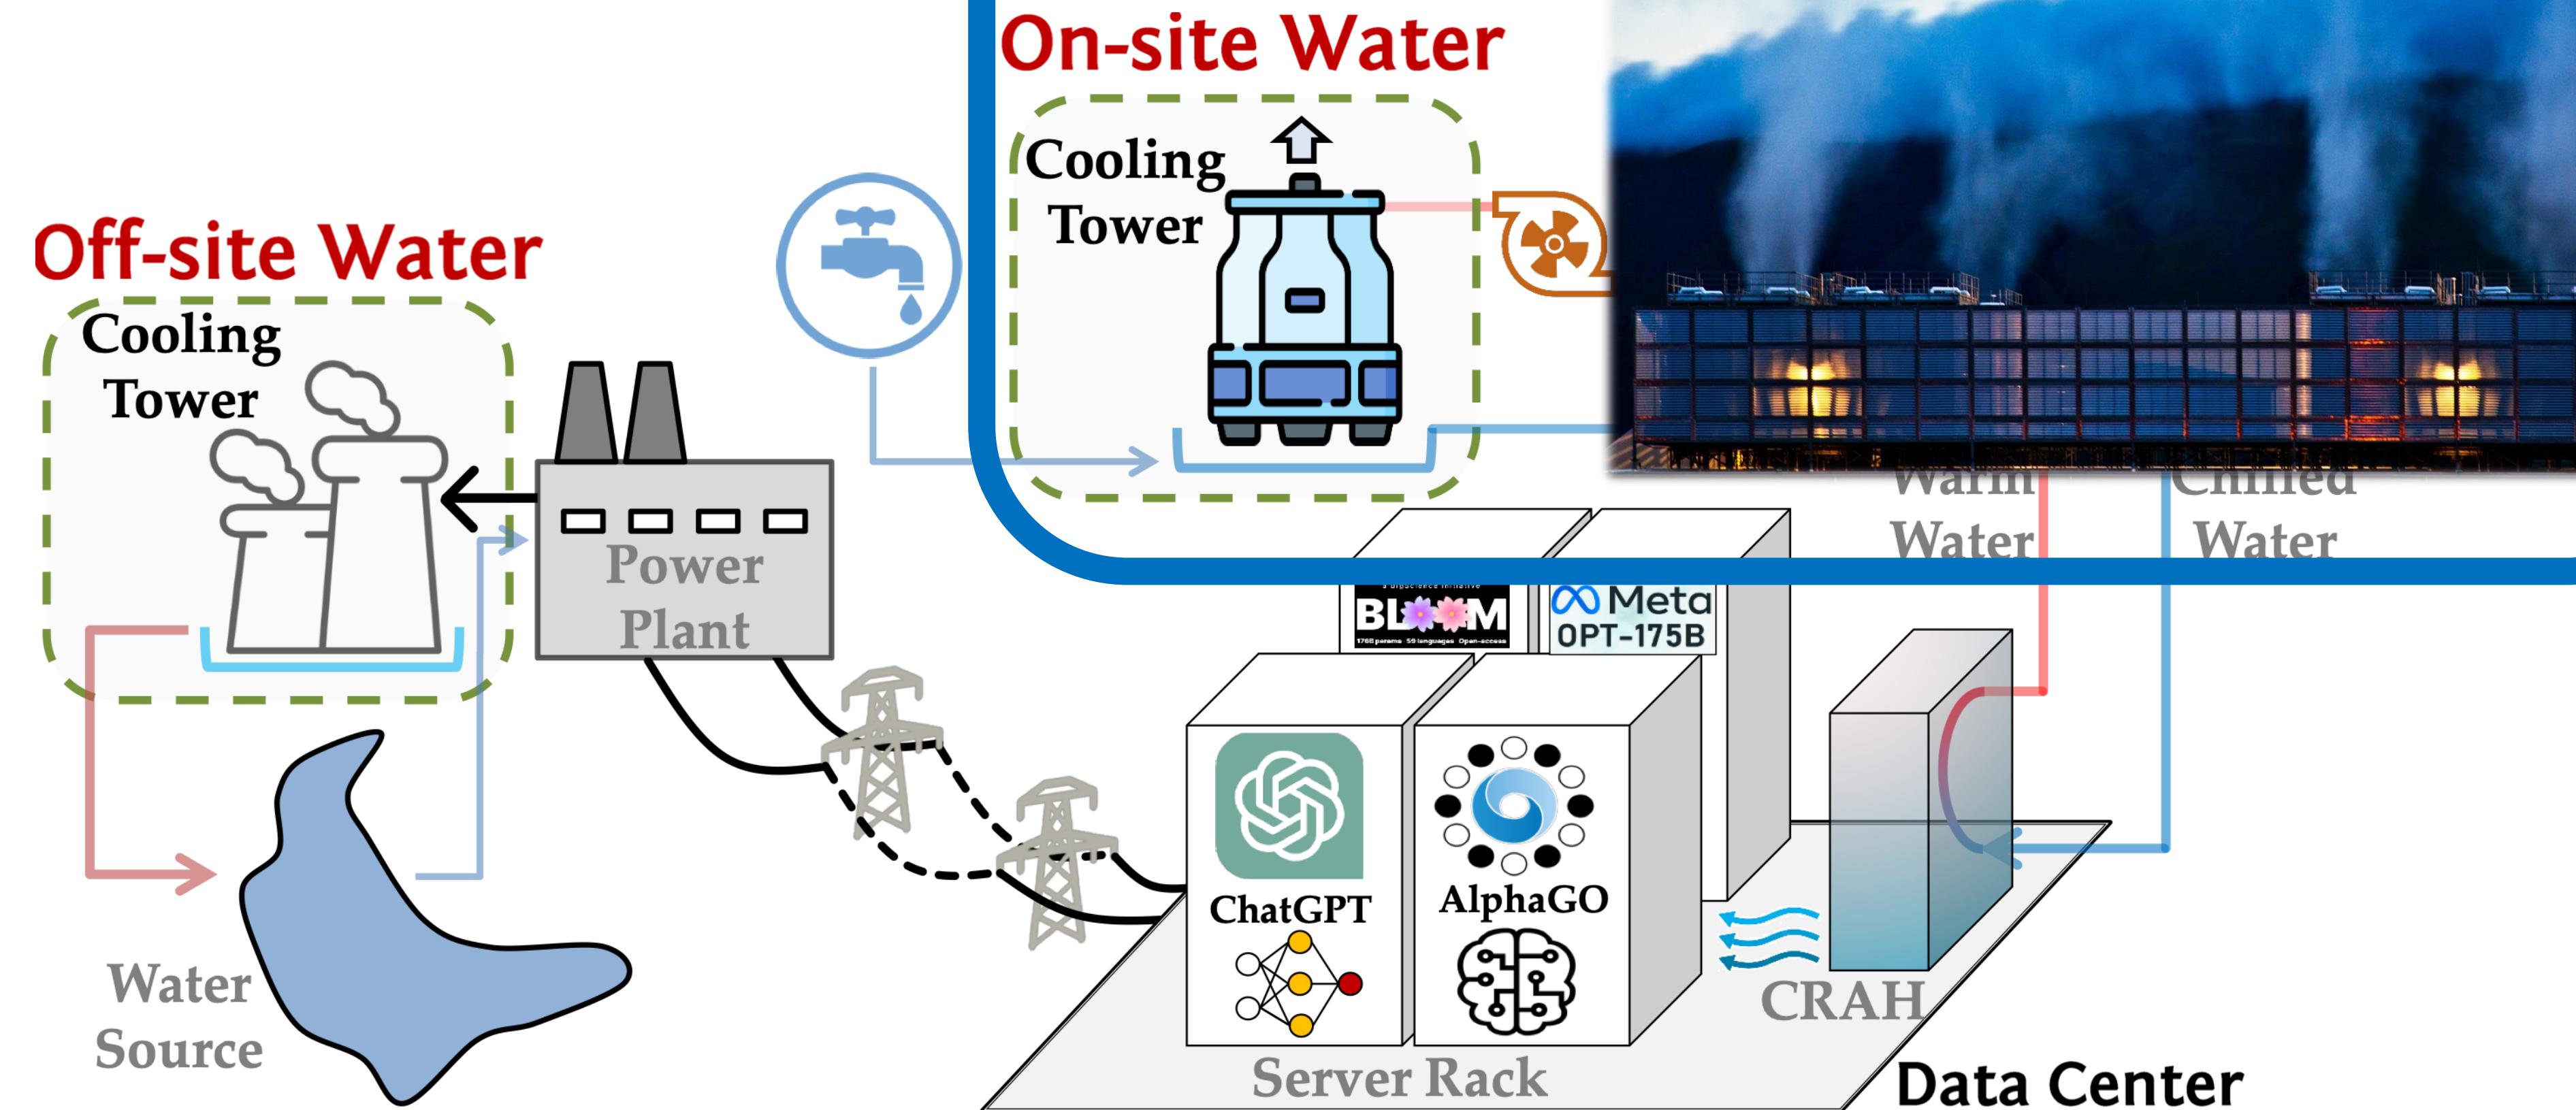

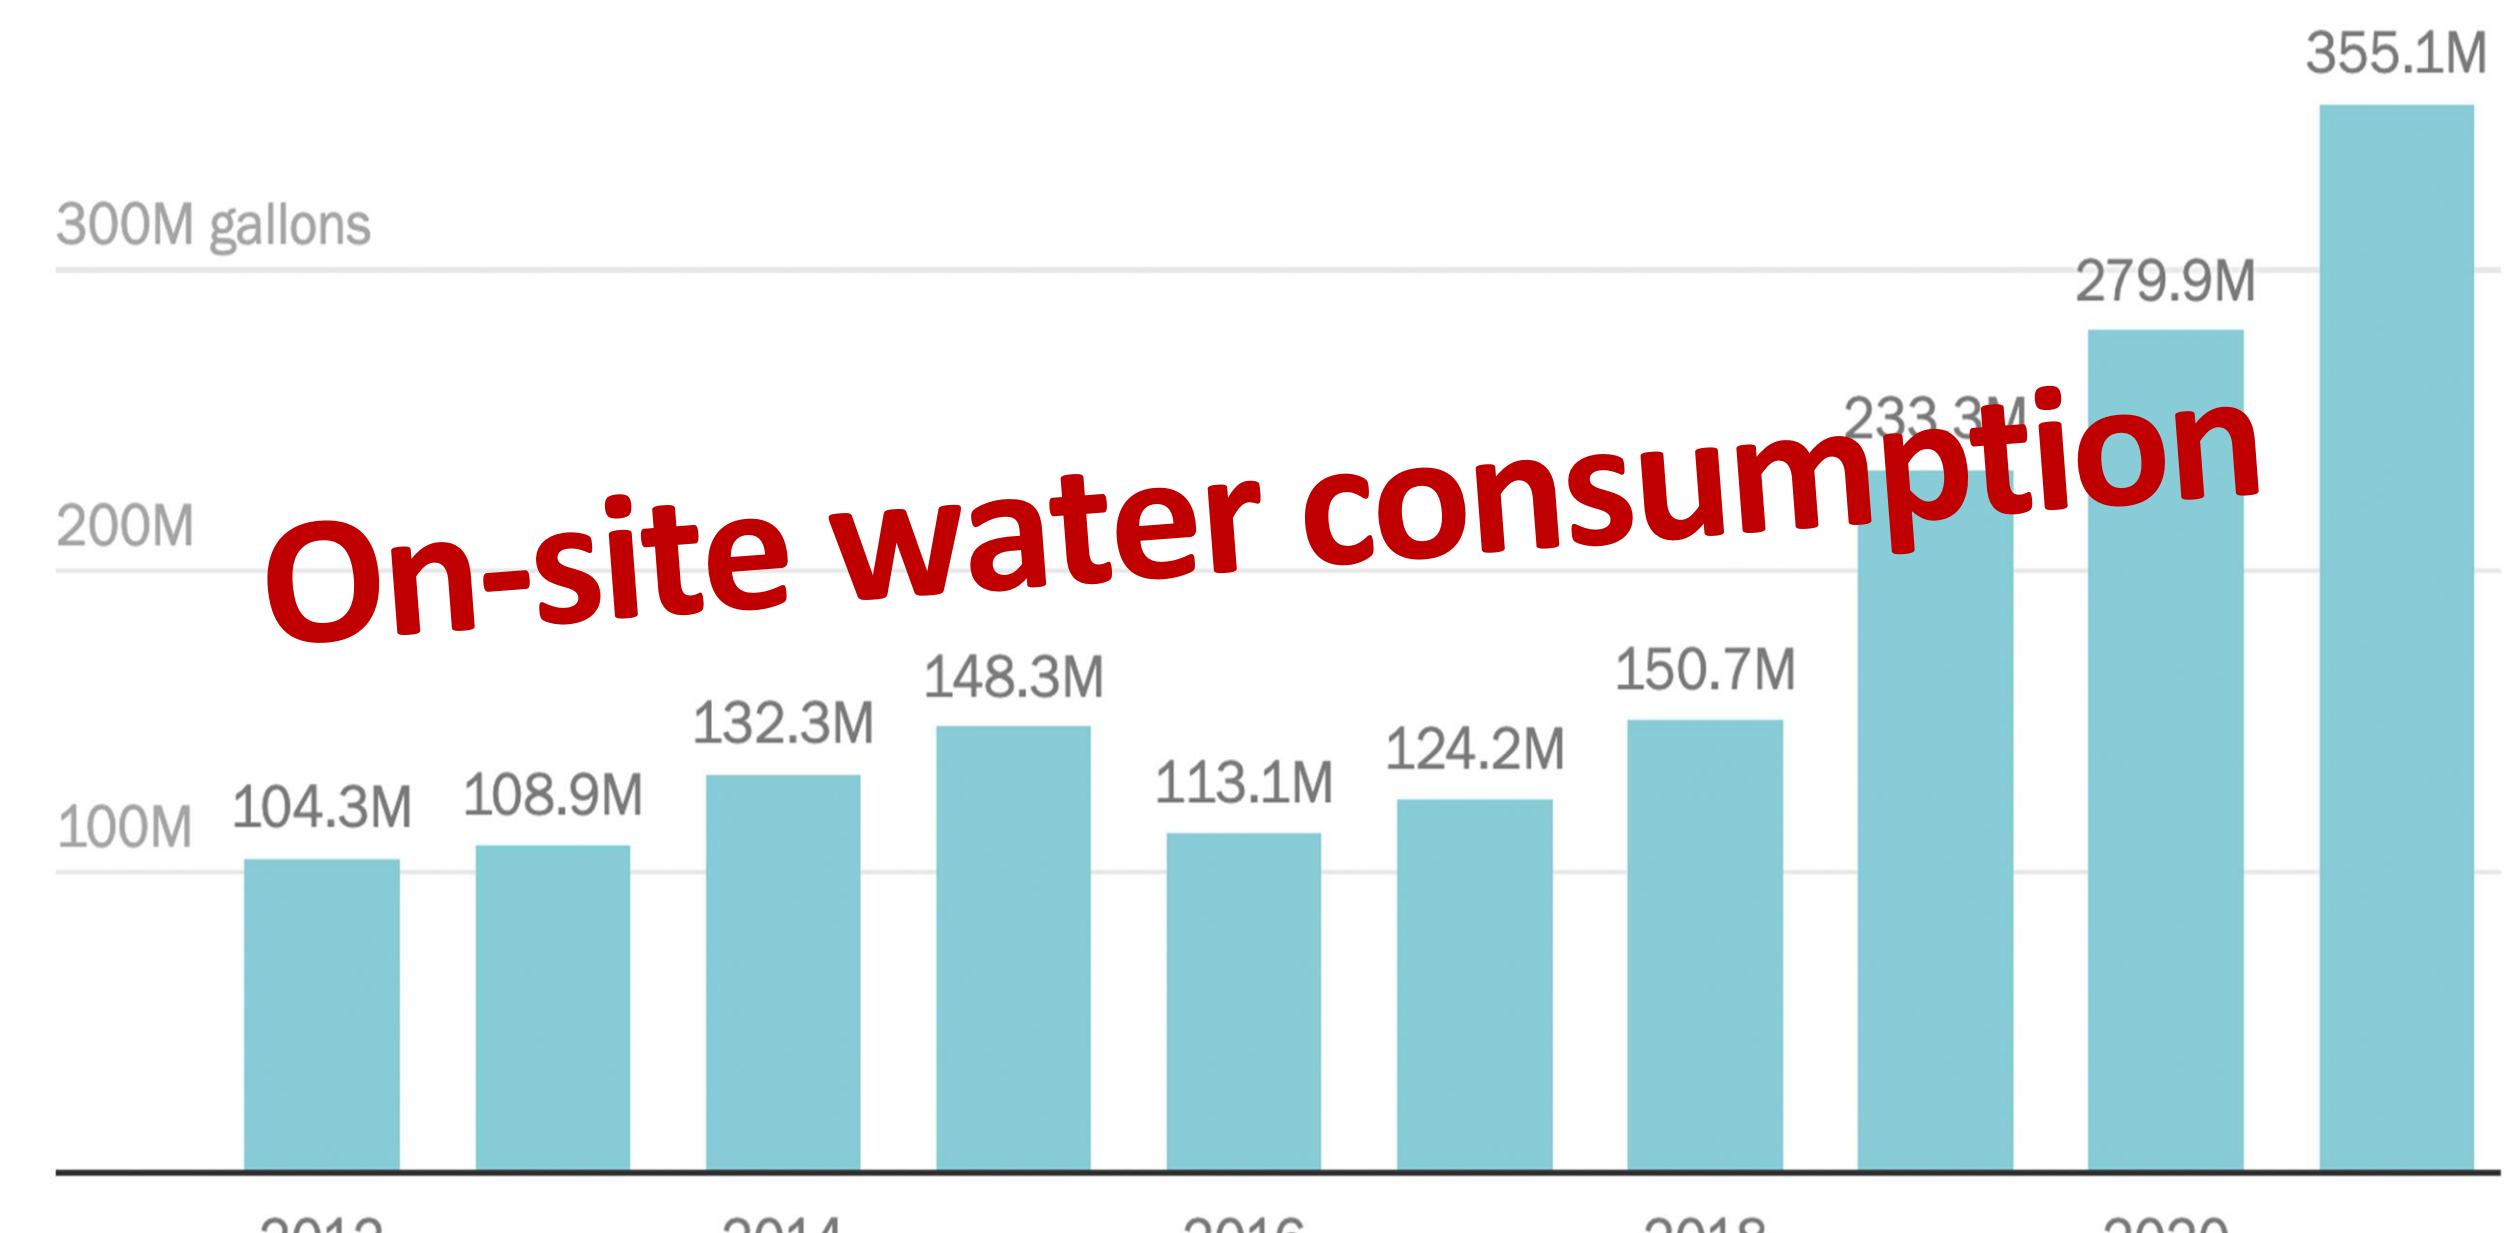

Figure 2. Multiple AI models are trained and/or deployed in the data center. Data center water footprint consists of two parts: on-site water and off-site water consumption

Data centers are guzzling water!

- A large data center can consume millions of gallons of potable water each day for on-site cooling.
- Google's data center used 355 million gallons of water in The Dalles, OR, in 2021, 29% of the city's total water consumption

Google's annual water use in The Dalles, in gallons

Google's data centers in The Dalles use nearly three times more water than they did five years ago and now account for more than a quarter of all the city's water use.

And this trend continues!

What about AI's water usage (withdrawal)?

~6.6 billion cubic meters in 2027

Based on the projected AI GPU energy consumption of up to 134 TWh (de Vries, 2023), US average water withdrawal for electricity generation 44L/kWh, PUE=1.1, on-site water withdrawal 1L/kWh.

What about AI's water usage (**consumption**)?

~0.6 billion cubic meters in 2027

Based on the projected AI GPU energy consumption of up to 134 TWh (de Vries, 2023), US average water consumption for electricity generation 3.14 L/kWh, PUE=1.1, on-site water consumption 0.8L/kWh.

ChatGPT is already “drinking” a lot of water

Table 2: Estimate of GPT-3’s average operational water footprint. “*” denotes data centers under construction as of July 2023, and the PUE and WUE values for these data centers are based on Microsoft’s projection.

Location	PUE	WUE (L/kWh)	Electricity Water Intensity (L/kWh)	Water for Training (million L)			Water for Inference (mL)			# of Inferences for 500ml Water

ChatGPT is already “drinking” a lot of water

Table 2: Estimated Water Use for ChatGPT by Region
July 2023, and construction as of

Location	# of Inferences for 500ml Water
US Average	29.6
Wyoming	40.0
Iowa	33.0
Arizona	15.1
Washington	10.4
Virginia	43.1
Texas	35.7
Singapore	33.9
Ireland	69.6
Netherlands	30.7
Sweden	17.3
Mexico*	20.9
Georgia*	47.2
Taiwan*	34.6
Australia*	26.1
India*	25.4
Indonesia*	25.5

ChatGPT needs about **500 ml of water** for answering
10-50 questions.

minimizing **each region's** environmental cost

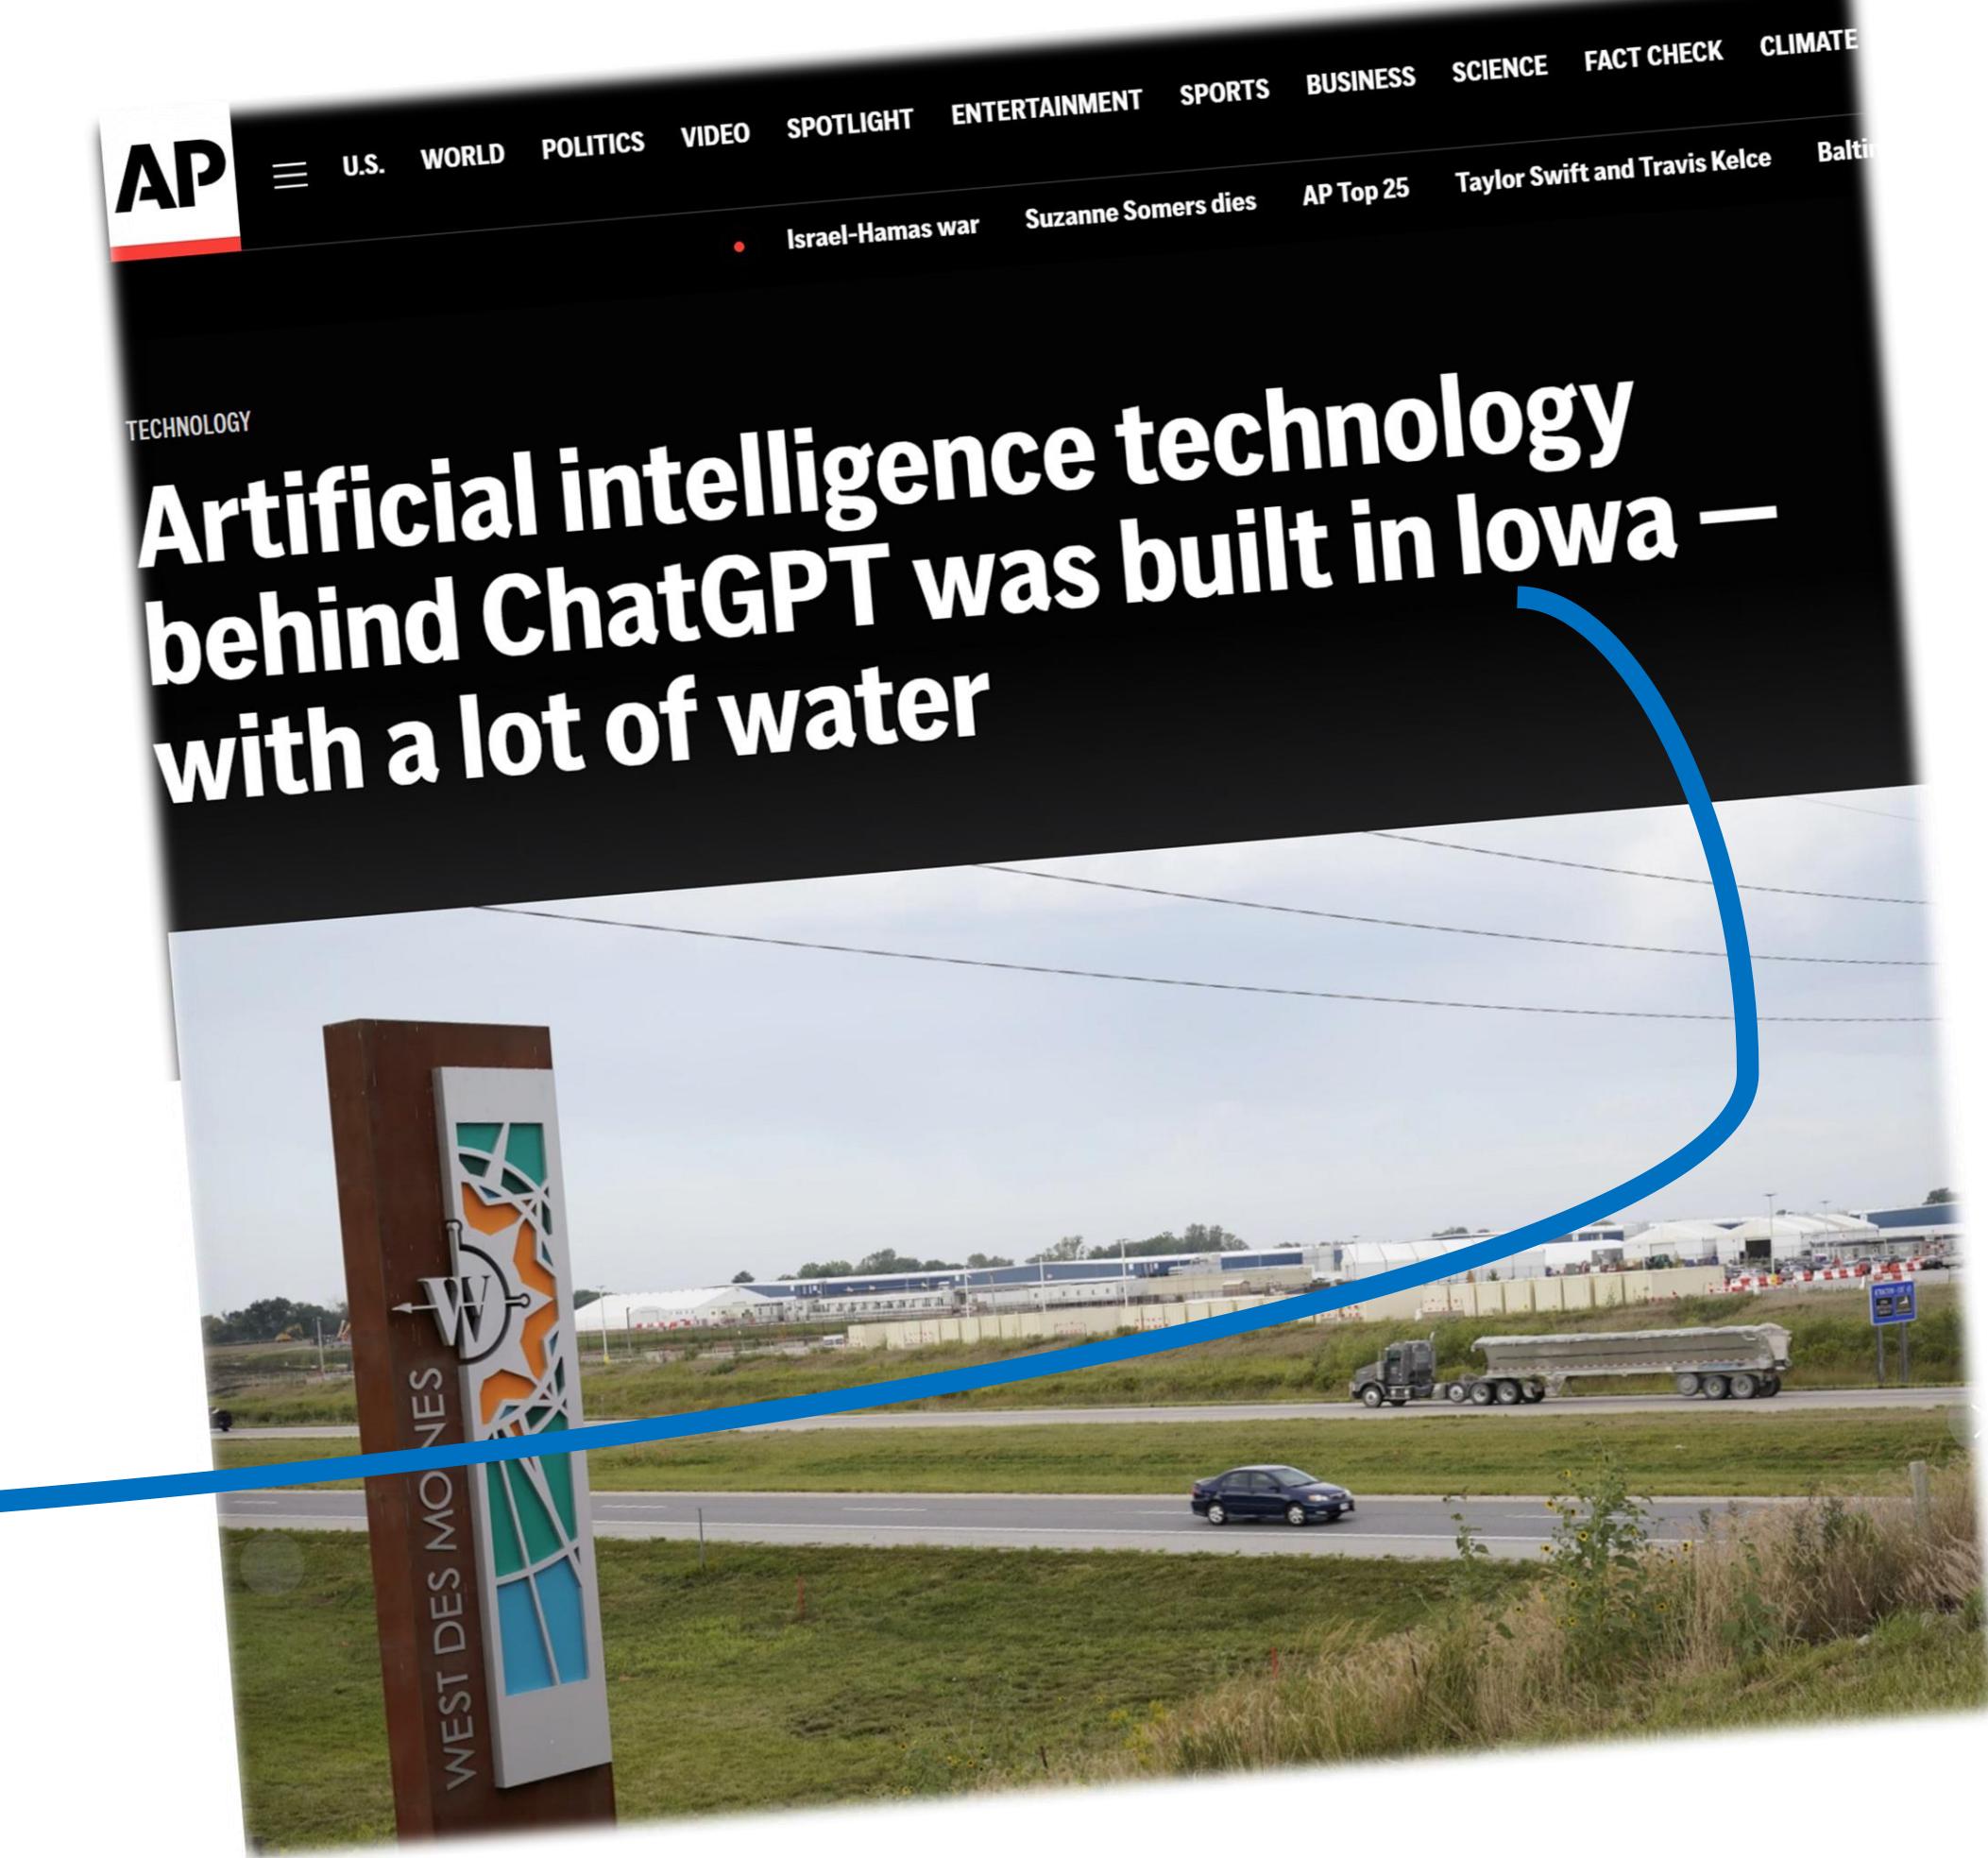

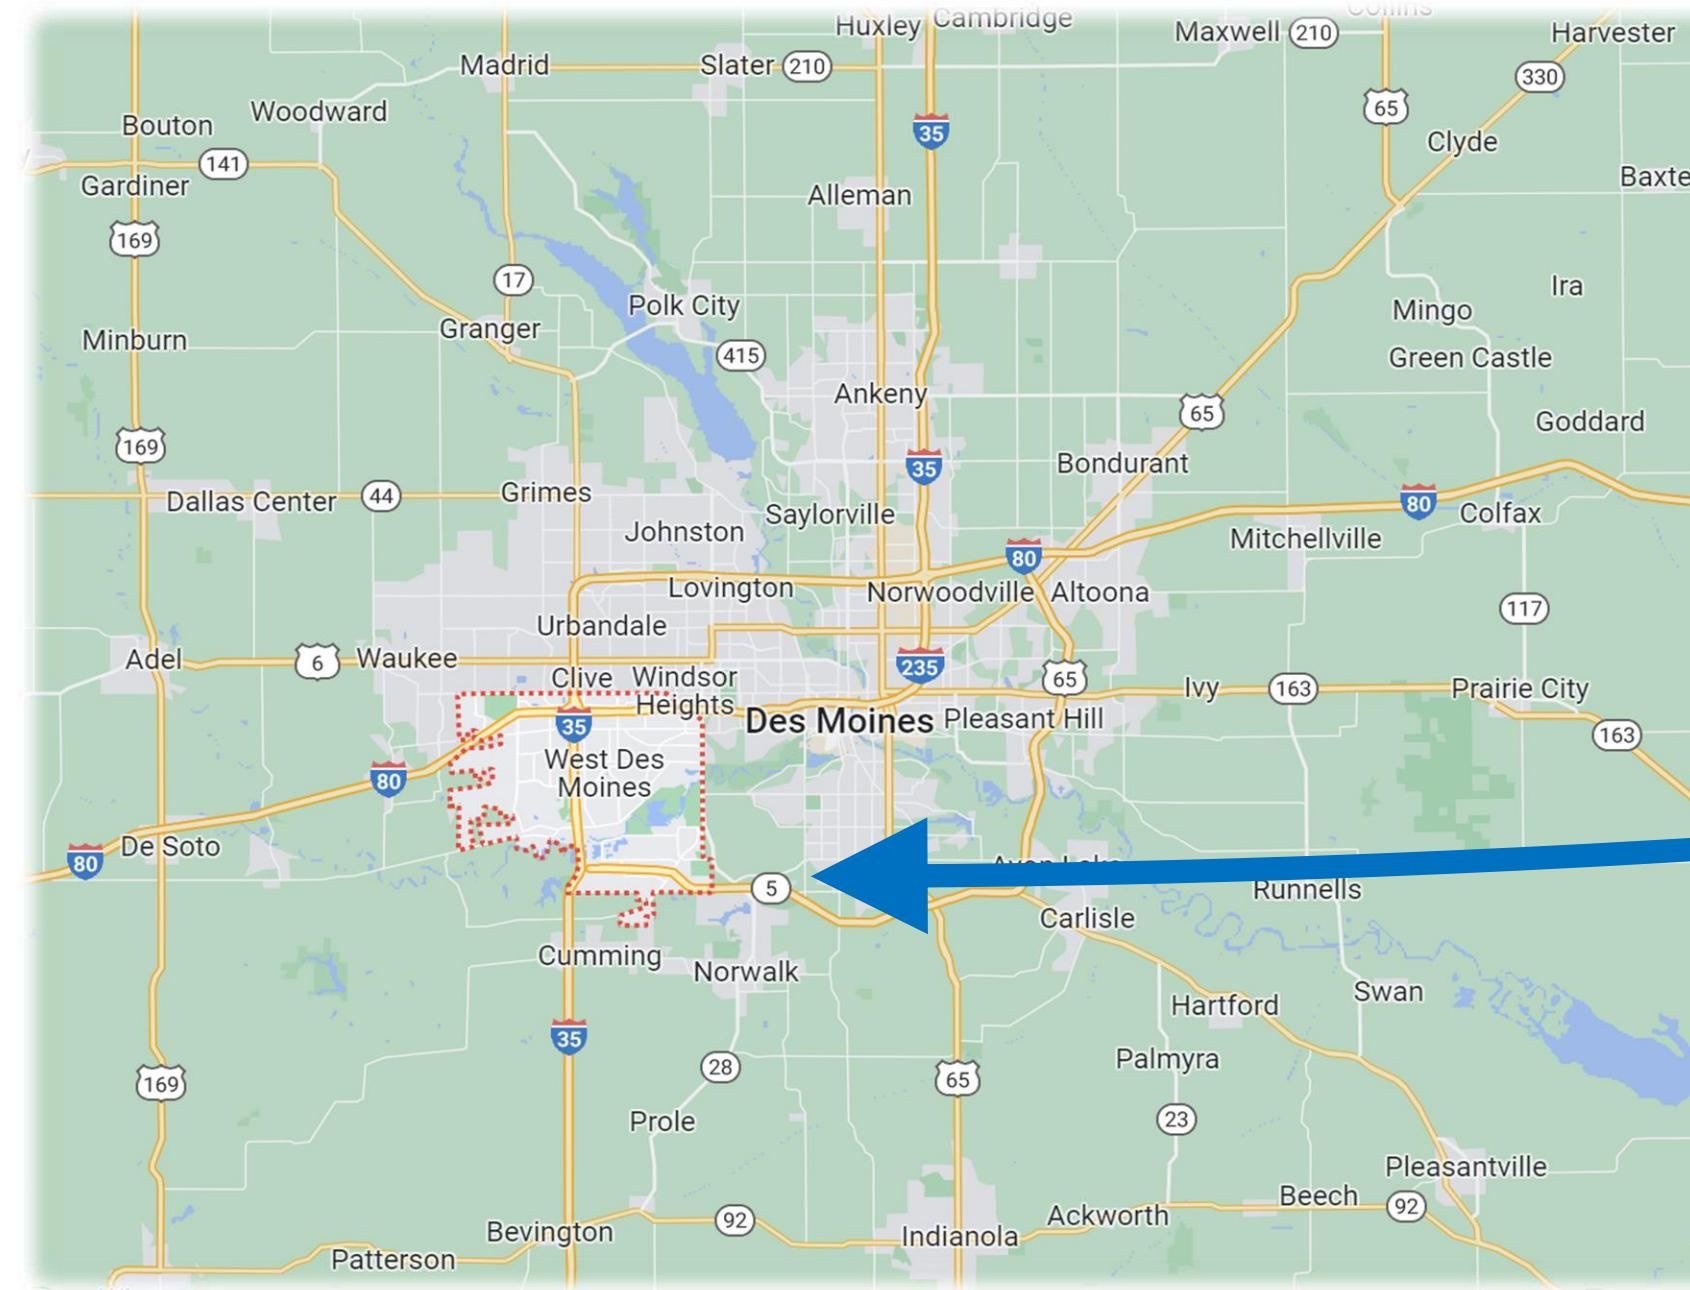

Electricity = Carbon + Water + Air & thermal pollution + ...

Electricity = Carbon + Water + Air & thermal pollution + ...

OpenAI ChatGPT 4.0

Computing's environmental inequity is emerging...

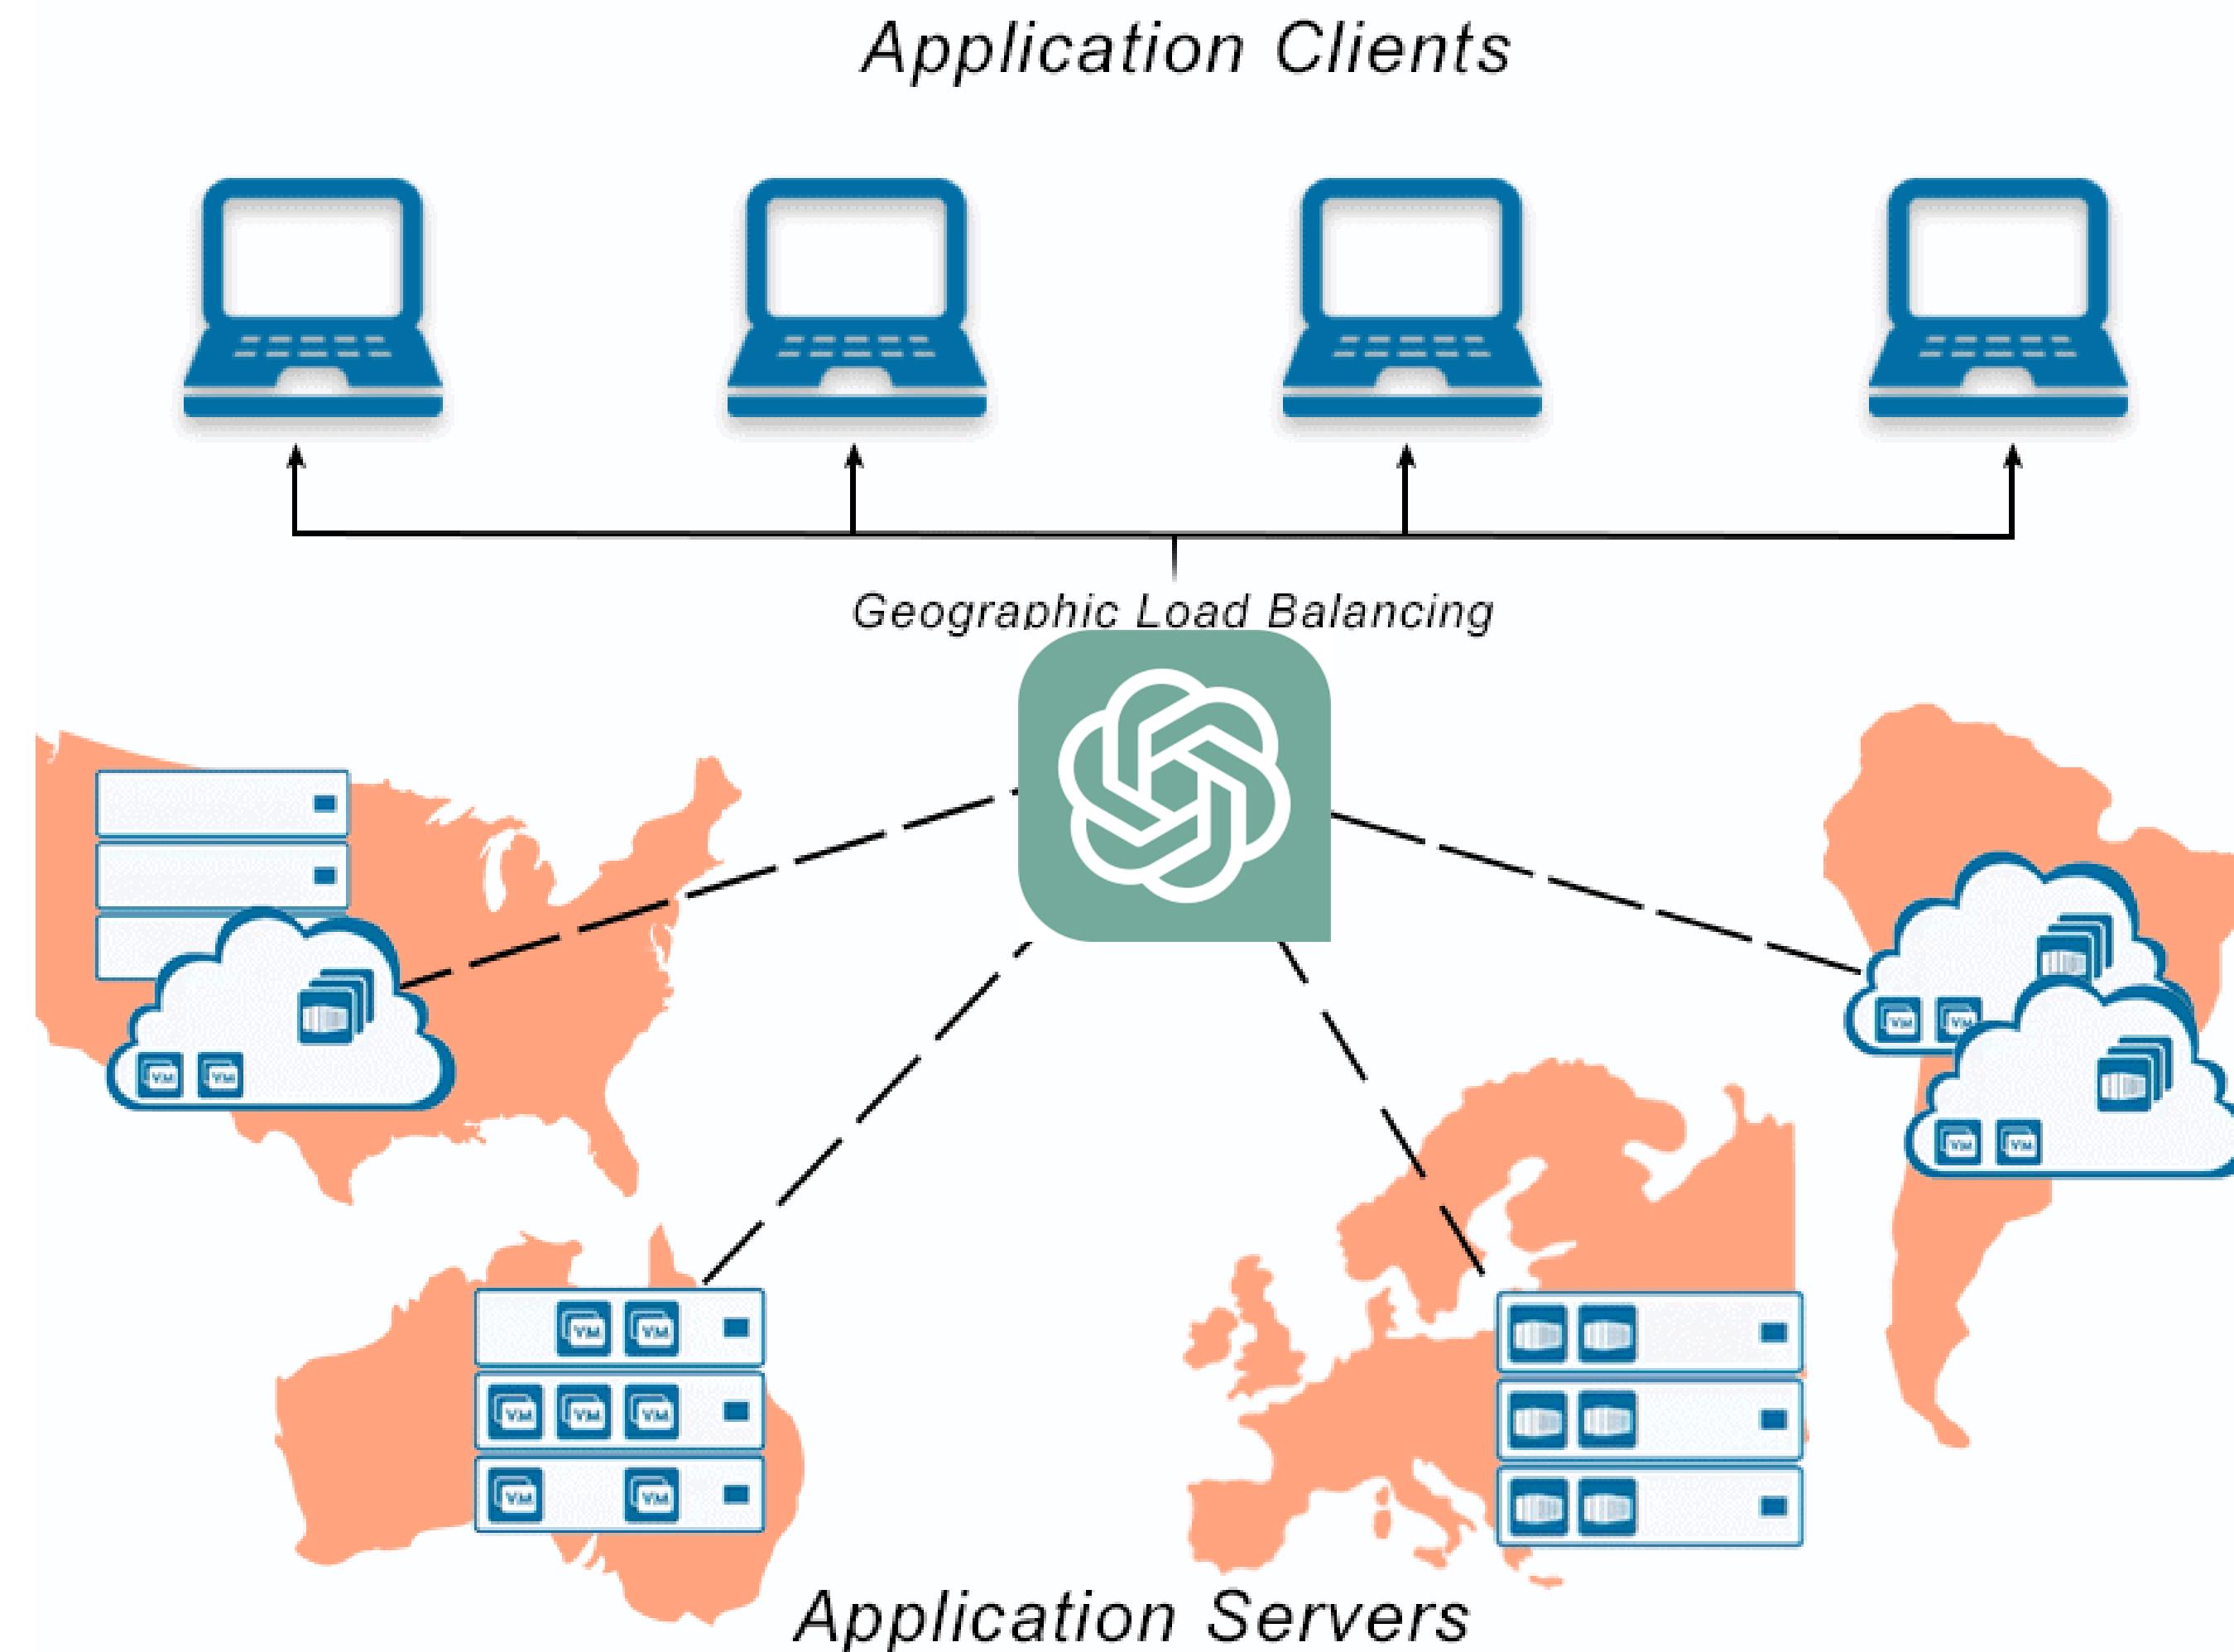

AI NOW

The constant push for scale in artificial intelligence has led Big Tech firms to develop hugely energy-intensive computational models that optimize for “accuracy” – through increasingly large datasets and computationally intensive model training – over more efficient and sustainable alternatives.^① As we increasingly become locked into using Big-Tech infrastructures, we also become locked into their voracious appetite for resources, necessitating a life cycle analysis: the data centers needed for computationally intensive AI have high energy costs and carry a massive carbon footprint.^② Computing technologies rely heavily on minerals that are procured under violent and exploitative conditions.^③ But these environmental harms are not evenly distributed; they disproportionately impact communities that are already marginalized, in a manner that reenacts historical practices of settler colonialism and racial capitalism.^④

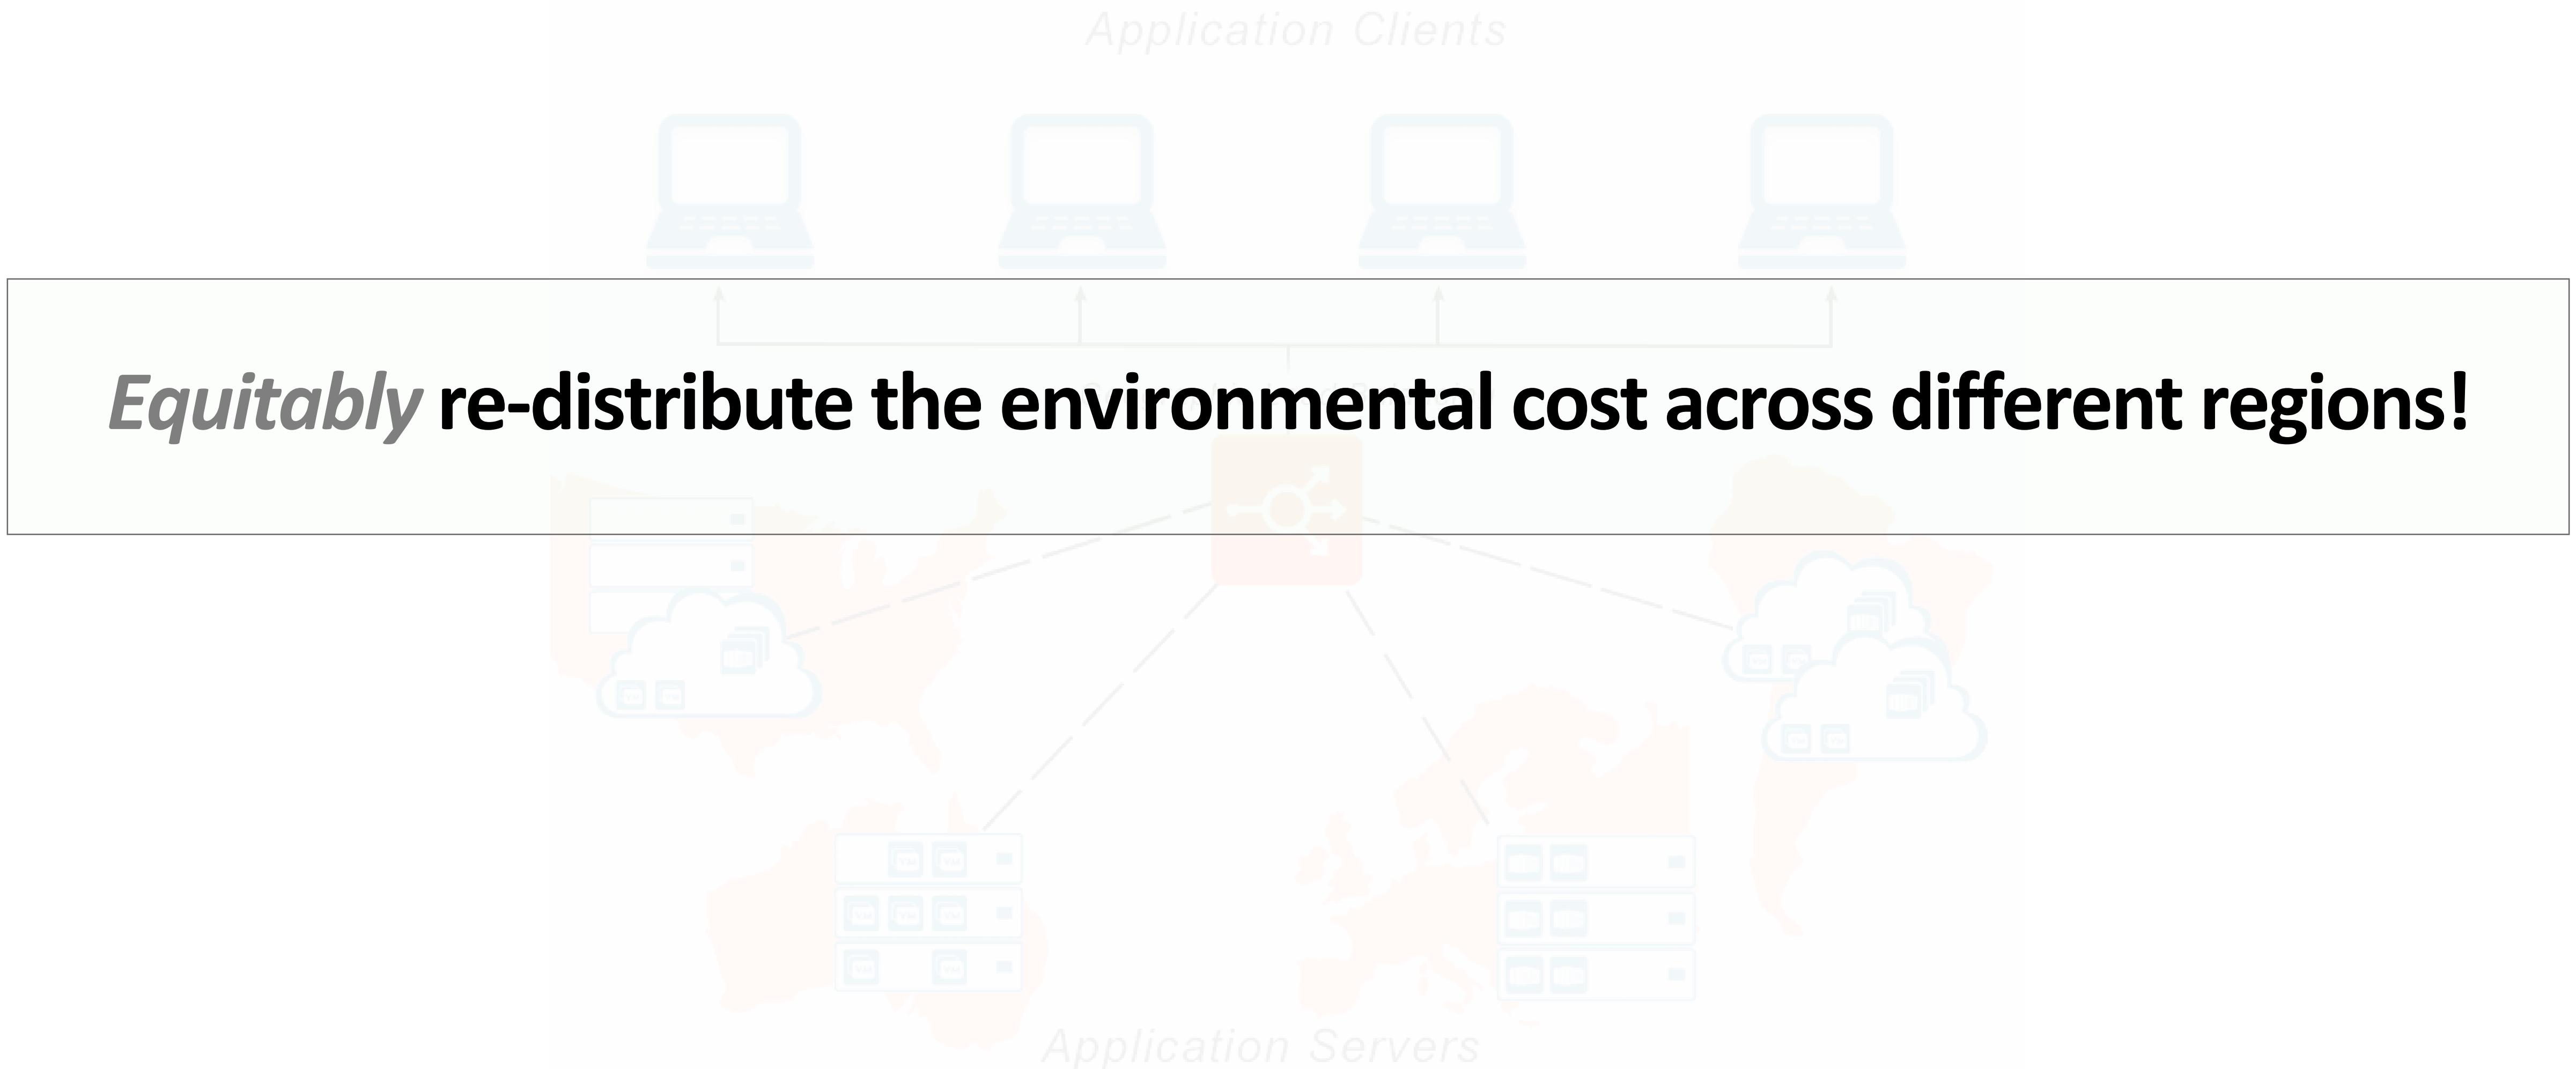

The uneven distribution of AI’s environmental cost is “**historical practices of settler colonialism and racial capitalism**”.

In 2022, the **United Nations Educational, Scientific and Cultural Organization (UNESCO)** recommends that “**AI should not be used**” if it creates “**disproportionate negative impacts on the environment**”.
